There is an **undirected** graph with n nodes, where each node is numbered between 0 and $n - 1$. You are given a 2D array `graph`, where `graph[u]` is an array of nodes that node `u` is adjacent to. More formally, for each `v` in `graph[u]`, there is an undirected edge between node `u` and node `v`. The graph has the following properties:

- There are no self-edges (`graph[u]` does not contain `u`).
- There are no parallel edges (`graph[u]` does not contain duplicate values).
- If `v` is in `graph[u]`, then `u` is in `graph[v]` (the graph is undirected).
- The graph may not be connected, meaning there may be two nodes `u` and `v` such that there is no path between them.

A graph is **bipartite** if the nodes can be partitioned into two independent sets `A` and `B` such that **every** edge in the graph connects a node in set `A` and a node in set `B`.

Return `true` if and only if it is **bipartite**.

Example 1:

Input: `graph = [[1,2,3],[0,2],[0,1,3],[0,2]]`
Output: `false`
Explanation: There is no way to partition the nodes into two independent sets such that every edge connects a node in one and a node in the other.

Example 2:

Input: `graph = [[1,3],[0,2],[1,3],[0,2]]`
Output: `true`
Explanation: We can partition the nodes into two sets: `{0, 2}` and `{1, 3}`.

Constraints:

- `graph.length == n`
- `1 <= n <= 100`
- `0 <= graph[u].length < n`
- `0 <= graph[u][i] <= n - 1`
- `graph[u]` does not contain `u`.
- All the values of `graph[u]` are **unique**.
- If `graph[u]` contains `v`, then `graph[v]` contains `u`.
